Normalization

- The process of decomposing unsatisfactory "bad" relations by breaking up their attributes into smaller relations.
- Normalization Avoids:
 - Update anomalies.
 - Deletion anomalies.
 - Insert anomalies.
 - Duplication of Data.
 - Frequent Null Values.
- Normalization is a method to remove all these anomalies and bring the database to a consistent state.

Functional Dependency

- Functional dependency is represented by an arrow sign (\rightarrow) that is, $X \rightarrow Y$, where X functionally determines Y. It is read as: X determines Y OR Y depends on X.
- Examples:
 - Social security number determines employee name
 $SSN \rightarrow ENAME$
 - Project number determines project name and location.
 $PNUMBER \rightarrow \{PNAME, PLOCATION\}$
 - Employee ssn and project number determines the hours per week that the employee works on the project.
 $\{SSN, PNUMBER\} \rightarrow HOURS$

Normalization Forms

- First Normal Form (1NF).
- Second Normal Form (2NF).
- Third Normal Form (3NF).
- Fourth Normal Form (4NF).
- Boyce Codd Normal Form (BCNF).
- Fifth Normal Form (5NF).
- Domain Key Normal Form (DK/NF).

Better Database Design as we go down

First Normal Form

- First Normal Form is defined in the definition of relations (tables) itself.
- This rule defines that all the attributes in a relation must have atomic domains. The values in an atomic domain are indivisible units.
- contains no multi-valued attributes

<u>No.</u>	course	content

CS002	Design

<u>CNo.</u>	<u>content</u>
CS001	C#
CS001	oop
CS002	HTML
CS002	CSS

Second Normal Form

- **Prime attribute:** An attribute, which is a part of the candidate-key, is known as a prime attribute.
- **Non-prime attribute:** An attribute, which is not a part of the prime-key, is said to be a non-prime attribute.
- Every non-prime attribute should be fully functionally dependent on Table Key.

<u>EId</u>	<u>PId</u>	WorkHours	ENAME
E1	P1	12	Ali
E2	P1	10	Ramy

<u>EId</u>	ENAME
E1	Ali
E2	Ramy

<u>EId</u>	<u>PId</u>	WorkHours
E1	P1	12
E2	P1	10

Third Normal Form

- A relation is in **third normal form** if it is in 2NF, AND no transitive dependencies exist.

<u>Id</u>	Name	City	Zip
E1	Ali	Minia	16111
E2	Ramy	Minia	16111

<u>City</u>	Zip
Minia	16111

<u>Id</u>	Name	City
E1	Ali	Minia
E2	Ramy	Minia

Joins

- **Join** is a combination of a Cartesian product followed by a selection process. A Join operation pairs two tuples from different relations, if and only if a given join condition is satisfied.
